

## ABSTRACT OF THE DISCLOSURE

A golf cart for supporting a golf bag and clubs in a vertically upright condition upon an underlying surface includes a carriage for accommodating the bag. Two axially aligned forward wheels are axially rotatably connected to the carriage. At least one rearward wheel is swivelably and rotatably mounted to the carriage. Each wheel is rotatably engagable with the underlying surface. The carriage includes a base for engaging the bottom of the golf bag. A support frame extends upwardly from the base and carries at least one upper holder spaced above the base for engaging the bag placed on the base such that the bag is held in a vertically upright condition. A handle is attached to and extends rearwardly of the frame such that applying a generally horizontal pushing or pulling force to the handle causes the cart to move over the underlying surface on the wheels while the bag and clubs are maintained in the vertically upright condition.
